FORS2_impol_redux Update log

20/02/2025
-- Minor updates to parameters to identify sources and estimate FWHM.

17/01/2025
-- Added mjd column in the output textfiles. This is measured from the beginning of the set of observations

6/01/2025
-- Fixed a bug when removing science files as part of the pipeline at the very beginning.
-- Fixed a bug related to DaoStarFinder routine inside PhotUtils. Seems like the routine crashed sometimes when no targets are found.

10/12/2024
-- Changed the way how filters are identified in join_chips(). Before they were identified using the file names, but that crashes if the source name has "_" in them. Now the filters are identified using the science file headers.

20/06/2024
-- Fixed a bug in cross matching "stars" for the ISP estimation. Criteria to include stars from e- and o-beams appear to have been slightly different resulting in more stars being cut in some situations.

23/04/2024
-- Added option to save 2d bkg map with -save_bkg
-- Added option to set background annulus inner and outer radii with -r_annu
-- Fixed a bug of excluding sources in case -set_fwhm is used.

21/09/2023
-- Fixed bug causing pipeline to crash if a set of data with multiple filters was being reduced

21/06/2023
-- No longer crashes if no input is given when the pipeline asks for files to delete

14/04/2023
-- No longer crashes if answer to prompt to remove bad files is empty
-- No longer crashes if <RAW_DIR> empty (or non-existent), but SCI files exist
-- Fixed a bug where the correct target was not carried to aperture photometry if the target was not originally identified by photutils and had to be forced

30/03/2023
-- Shifted the centre of the drawn circles for the stamps by +0.5px to be in the centre of the pixel and not at the bottom left corner

24/03/2023

-- Fixed for Issue #1

-- TARGET input is now an optional parameter. If not provided or provided and the name doesn't match with fits headers, user prompted to choose correct name from a list

-- Added optional parameter –plot_stamps

-- plots stamps for the apertures upon request

-- Fixed logging issue. Now provides the actual coordinates FWHM and SNR found
